layout: post title: Test markdown subtitle: Each post also has a subtitle gh-repo: daattali/beautiful-jekyll gh-badge: [star, fork, follow] tags: [test] comments: true

You can write regular markdown here and Jekyll will automatically convert it to a nice webpage. I strongly encourage you to take 5 minutes to learn how to write in markdown - it'll teach you how to transform regular text into bold/italics/headings/tables/etc.

Here is some bold text

Here is a secondary heading

Here's a useless table:

Number	Next number	Previous number
Five	Six	Four
Ten	Eleven	Nine
Seven	Eight	Six
Two	Three	One

How about a yummy crepe?

It can also be centered!

{: .center-block :}

Here's a code chunk:

```
var foo = function(x) {
  return(x + 5);
}
foo(3)
```

And here is the same code with syntax highlighting:

```javascript
var foo = function(x) {
  return(x + 5);
}
foo(3)
```

And here is the same code yet again but with line numbers:

{% highlight javascript linenos %} var foo = function(x) { return(x + 5); } foo(3) {% endhighlight %}

Boxes

You can add notification, warning and error boxes like this:

Notification

{: .box-note} **Note:** This is a notification box.

Warning

{: .box-warning} **Warning:** This is a warning box.

Error

{: .box-error} **Error:** This is an error box.

Error

{: .box-error} **Error:** This is an error box.
